

This does not work

I dont know why this wont work

Logo problem

My extension provides a logo at `_extensions/hsnr-aushang/HSNRfb10s.png`. This worked just fine.... Now, after the summer break, I come back to see that is throws an error

The „logo“ file path (see `_extension.yml`) is now overwritten to „true“ instead.

If I set a „new“ logo in the qmd-document, it throws the same error, and „logo“ is TRUE.

If I set the „new“ logo to some fantasy-filename, it throws:

So, the file name is „there“. But if I state a „real“ existing file name, it goes back to „TRUE“.
